

CivicTwin AI

From citizen signals to infrastructure decisions.

An evidence-driven AI platform for understanding emerging public infrastructure needs across India.

Build with AI: Code for Communities, Second Edition
Track: AI for Digital Public Infrastructure & Governance

Public infrastructure signals are fragmented.

Signals stay scattered across locations, departments, channels, datasets and boundaries. That makes it hard to see where demand concentrates, which gaps are emerging, who is affected, and how investment context changes the picture.

A citizen report is useful. A connected evidence trail is more useful.

AFTER: connected evidence trail

CivicTwin doesn't simply collect complaints. It connects them to the infrastructure context around them.

CivicTwin AI turns fragmented signals into infrastructure intelligence.

Teal outline: Gemini · Grey outline: application · Navy fill: human

AI interprets the signal. The application calculates the evidence. Humans remain in control of the decision.

One workflow. From citizen signal to actionable evidence.

Screenshots must come from the deployed prototype. Label seeded data: Demonstration / synthetic data.

Infrastructure Risk Radar

See emerging problems before they become isolated tickets.

Illustrative demonstration data

EMERGING RISK
Water infrastructure
High signal
Evidence

- request cluster
- infrastructure context
- trend
- demographic context

Risk is derived from multiple evidence streams, not from a single AI-generated answer.

The AI does not make the decision. It makes the evidence understandable.

DETERMINISTIC APPLICATION LAYER

- aggregation
- geographic analysis
- trend calculation
- infrastructure relationships
- priority calculation
- scenario simulation
- evidence IDs

GOOGLE GEMINI

- multilingual understanding
- structured extraction
- semantic interpretation
- issue clustering support
- evidence synthesis
- recommendation drafting

AI ≠ final decision

HUMAN REVIEW: inspect evidence · challenge assumptions · accept / edit / reject · audit decision

Every recommendation can be traced back to evidence.

EXAMPLE EVIDENCE CHAIN

No black-box recommendation. The analyst can inspect the evidence behind it.

Illustrative evidence IDs

From "Why is this a priority?" to "What changes the priority?"

CURRENT SCENARIO

WHAT-IF

Increase affected-population signal

↓ Recalculate

Priority signal
[INSERT ACTUAL PROJECT OUTPUT]

The simulator shows how assumptions affect the application-calculated priority signal. It is not an LLM-generated score.

Illustrative UI example. Replace with actual project output.

Designed for India-scale civic intelligence.

COMMON PLATFORM SERVICES

multilingual AI · common data model · evidence graph · configurable analytics · state-specific data adapters · shared model services · auditability

The architecture is designed so another state can be added through data and configuration layers rather than a separate product.

Prototype coverage: [INSERT ACTUAL COVERAGE]

Built as a deployable Digital Public Good.

DEPLOYABLE

- Cloud-native modular services
- API-based architecture
- Database-backed analytics
- Production configuration

INTEROPERABLE

- Data-source adapters
- Common civic data model
- Geographic hierarchy
- Evidence IDs

RESPONSIBLE

- Human review
- AI audit trail
- Data provenance
- Confidence and limitations

SCALABLE

- State → district → local
- Multilingual channels
- Configurable priority model
- Reusable AI services

POTENTIAL USERS

Citizens · District analysts · State planners · Infrastructure teams · Public-sector innovation teams · NGOs / civic organizations

From scattered signals to evidence for better infrastructure decisions.

Google AI + Data + Geospatial Intelligence + Explainable Analytics
